AUTHORS: Bochever, F.M., (VODGEO), and Tsayurupa, P.V. (GOSGORKHIM-PROYEKT)

TITLE: The Forecast of Higher and Lower Subsurface Water Levels Caused by the Draining of Useful Mineral Deposits (Prognoz pritoka i snizheniya urovney podzemnykh vod pri osushenii mestorozhdeniy poleznykh iskopayemykh)

PERIODICAL: Razvedka i Okhrana Nedr, 1958, Nr 5, pp 45-52 (USSR)

ABSTRACT: Using the example of the Razdol'sk sulphur deposit, situated south of L'vov, the authors describe the method of calculating the volume of underground water to be pumped out to lower the level of this water enough to exploit the deposit. A formula by which these calculations can be made is given. There are 2 tables, 4 graphs, and 6 references, of which 5 are Soviet and 1 American.

AUTHOR: Bochever, F.M.

TITLE: Hydrogeological Calculations of Drainage in the Open-cast Mining of Mineral Deposits

PERIODICAL: Razvedka i okhrana nedr, 1959, Nr 8, pp 37-43 (USSR)

ABSTRACT: The author proposes an analytic and graphic method of calculating the total ground water discharge from an opencast mine necessary to lower its level to a given point in a given time, the discharge being realized by means of a series of equally-distanced draining bore-holes. If n boreholes are equally distributed along the 2L line with a total water discharge Q_c , and the water afflux is uniform along the 2L line so that it is equal q for a unity of this line, then

$$Q_c = 2qL \quad (1)$$

Card 1/4 (This method of uniform distribution of water dis-

SOV/132-59-8-9/18

Hydrogeological Calculations of Drainage in the Opencast Mining of Mineral Deposits

charge along the line of distribution of bore-holes was also adapted by N.S. Piskunov, I.A. Charnyy, V.M. Shestakov, and L.N. Pavlovskaya). If k is the filtration factor of the stratum, m - the thickness of the stratum, R - a dimensionless function conditionally-called "hydraulic resistance" or "a function of lowering", and Q_c representing the total discharge of ground waters necessary to maintain during a given time t so that in a given point M (Figure 1) the ground waters level S_t will be $H_e - H_t$ (H_e - is the initial water pressure and H_t - the pressure at the given moment t), then, says the author,

$$(2) S_t = \frac{Q_c}{\pi 4 \text{ km}} \cdot R \text{ or } Q_c = \frac{4\pi \text{ km } S_t}{R} \quad (3)$$

Card 2/ 4

SOV/132-59-8-9/18

Hydrogeological Calculations of Drainage in the Opencast Mining of Mineral Deposits

The value of the function R depends on the piezoconductivity factor (α) of the stratum, on the duration of pumping and on the distance (y) of points M_1 ,

M_2 , etc, from the line on which the bore-holes are distributed. The author then introduces dimensionless correlations $\alpha = \frac{at}{L^2}$ $y = \frac{y}{L}$. The value of the

R function for these points distributed on a line passing through the middle of the line L can be calculated from the graph (Figure 2) for different α and y . The graph was built by the author and V.N. L'vova by the numerical integration of the formula (1). At the end of 1957, L.N. Pavlovskaya (VNIIG imeni Vedeneyev) proposed another solution of the formula (1) at the Conference on the Lowering of Underground Water Levels held at VODGEO Institute.

Card 3/4

SOV/132-59-8-9/18

Hydrogeological Calculations of Drainage in the Opencast Mining
of Mineral Deposits

The author also proposes different variations of
formulae 2 and 3 for various cases of underground
water afflux. There are 3 sets of diagrams, 1
graph, 1 table, and 8 Soviet references.

TITLE: Physical properties of the complex compound $(CH_3)_2O \cdot BF_3$

SOURCE: AN GruzSSR. Soobshcheniya, v. 44, no. 3, 1966, 585-588

TOPIC TAGS: boron compound, ester, chemical separation, ^{solid} physical property

ABSTRACT: The complex compound of boron trifluoride with dimethyl ester is widely used in the separation of boron isotopes, but the published literature on the physical properties of this compound is insufficient and sometimes even contradictory. To fill this gap the authors carried out a detailed investigation of the properties of this compound. Since during the separation process the complex compound $(CH_3)_2O \cdot BF_3$ always is present in a mixture with the product of its thermal decomposition -- the complex compound $c(CH_3O)_3B \cdot 2BF_3$, the physical parameters of this mixture were also investigated as a function of the concentration of its components. Density was measured with the aid of a pycnometer as a function of temperature

Card 1/4

ACC NR: AP7001562

and found to vary from 1.270 g/cm^3 at 0.0°C and 1.239 g/cm^3 at 24.0°C to 1.142 g/cm^3 at 97.0°C . Specific heat was found to be 0.406 cal/g-deg . Heat of vaporization measured with the aid of the setup shown in Fig. 1

Fig. 1. Diagram of setup for measuring the heat of vaporization:
1 - vaporizer; 2 - pocket for measuring the vapor temperature; 3 - double-jacketed reflux condenser; 4 - flow meter; 5 - liquid tank; 6 - pocket for measuring the temperature of the condensed complex compound

Card 2/4

ACC NR: AP7001562

and found to be 20.9 ± 0.2 kcal/mole. Vapor viscosity was measured by means of device shown in Fig. 2 and found to range from $215 \cdot 10^{-6}$ poises at 98°C to $315 \cdot 10^{-6}$ poises at 129°C .

Fig. 2. Diagram of setup for determining vapor viscosity:

1 - vaporizer; 2 - rheometer; 3 - reflux condenser; 4 - flow meter; 5 - manometer

Card 3/4

ACC NR: AP7001562

The viscosity of the liquid compound was determined with the aid of a standard viscosimeter and found to range from $2.05 \cdot 10^{-2}$ poises at 15°C to $0.88 \cdot 10^{-2}$ poises at 82°C . Surface tension, as determined by the capillary method, ranged from 36 dynes/cm at 0°C to 27 dynes/cm at 90°C , and the refractive index, as determined by means of an Abbe-type refractometer, ranged from $1.3102 n_D^{20}$ for pure $\text{c}(\text{CH}_3\text{O})_3\text{B} \cdot 2\text{BF}_3$ to $1.3325 n_D^{20}$ for a $\text{c}(\text{CH}_3\text{O})_3\text{B} \cdot 2\text{BF}_3$ solution containing 50% $(\text{CH}_3)_2\text{O} \cdot \text{BF}_3$. These findings on the physical properties of the complex compound $(\text{CH}_3)_2\text{O} \cdot \text{BF}_3$ make possible the prior calculation and evaluation of the hydrodynamic processes in separatory columns for the production of boron isotopes, as well as thermal calculations. Knowledge of the density and refractive index of mixtures of this compound and its liquid decomposition product makes possible a rapid quantitative analysis of the degree of thermal decomposition of this compound in the columns. Orig. art. has: 2 figures, 7 tables.

Leningrad--gorod tekhnicheskogo progressa (Leningrad, City of Technical Progress)
[Leningrad] Lenizdat, 1957. 144 p. 5,000 copies printed.

Ed.: Lepin, A. E.; Tech. Ed.: Levonevskaya, L. G.

PURPOSE: The purpose of this book is to acquaint the reader with technical and scientific achievements in the Leningrad industrial area since the October Revolution.

COVERAGE: The authors start by giving a brief historical review of political and industrial developments in the Leningrad area. They extol the ideological aspects of industrial development and give some examples of methods used to increase productivity. The names of various revolutionaries, party members, artisans, innovators, engineers and scientists are given. There are no references.

TITLE: Rout of Hitler's Troops Near Moscow (Fifteen Years Since the Great Battle)
(Razgrom gitlerovskikh voyak pod Moskvoy (k 15-letiyu velikoy bitvy)

PERIODICAL: Radio, 1957, Nr 1, pp 4-5 (USSR)

ABSTRACT: A short review of the defense of Moscow in 1941 is presented, pretending to be "scientific and objective." At the start of the general offensive against Moscow, 80 German divisions (23 tank and 9 motorized) were concentrated in the Moscow theater. It is claimed that the Germans approached Moscow within 25 to 40 km. It is also claimed that 50 German divisions, including 125,000 soldiers and officers, were routed from the Moscow area by 1942. The role of Soviet radio operators in the defense of Moscow is emphasized. Georgiy Tkachenko, senior sergeant, penetrated the enemy lines 6 times near Naro-Fominsk and supplied most valuable information about enemy forces. Radio also kept contact between Soviet guerrillas to the rear of the enemy and the main Soviet forces. It is also claimed that the ultimate Soviet victory was due to the "efforts of the entire nation and its glorious Soviet army, due to organizational activities of the Communist party and the Soviet government." The role of Soviet volunteer divisions and guerrilla groups is mentioned.

TITLE: Elastic scattering of ¹⁹deuterons by separated nickel and zinc isotopes

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47,
no. 3, 1964, 855-859

TOPIC TAGS: nickel, zinc, isotope, elastic scattering, deuteron
scattering, isotopic effect

ABSTRACT: The angular distributions of the elastically scattered
deuterons were measured with a 90° magnetic analyzer. The deuteron
energy was 6.5 MeV, close to the optimal value for studying the in-
fluence of the surface structure on the angular distribution of
elastically scattered deuterons. The experimental method was de-

Card 1/3

L 11059-45

ACCESSION NR: AP4046398

scribed elsewhere (Nemilov and Litvin, PTE, No. 2, 32, 1960). The targets were thin self-supporting foils ($\sim 2 \text{ mg/cm}^2$) of separated isotopes of nickel and zinc, prepared in accordance with a previously described procedure (Bochin et al., Report on (D, p) Reactions at the Paris Congress on Nuclear Physics, 1964). A distinct isotopic effect was observed in the elastic scattering of the deuterons, resulting in a systematic increase in the deviation of the cross section from the Rutherford cross section as pairs of neutrons are added to an even-even nucleus. Computer calculations of the elastic d-d scattering, using the optical model with the Woods-Saxon potential, have shown that the observed isotopic effect can be attributed to a difference in the diffuseness of the nuclear boundaries in the different isotopes. Comparison of theory and experiment yielded the nuclear boundary diffuseness parameter for all the stable isotopes of nickel and zinc. Orig. art. has: 2 figures, 2 formulas, and 1 table.

Abstract : Sewage from the Lyuberetskiy Filtration Fields (Moskovskaya Oblast') when used four times in irrigation increased the potato yield on unfertilized ground by 5-7 tons per hectare, on ground fertilized with manure in a dosage of 30 t. per ha. by 15-17 t. per ha; in some varieties the starch percentage dropped by 2-5%. Irrigating a long time before the potato harvest decreased its taste qualities by an insignificant amount.

TITLE: Isotopic targets for nuclear research

SOURCE: Moscow. Institut atomnoy energii. Doklady, IAE-973, 1965.
Izotopnyye misheni dlya yadernykh issledovaniy, 1-18

TOPIC TAGS: isotope, particle accelerator target, metal film,
nuclear spectroscopy

ABSTRACT: The article describes the technology of preparing thin target foils of isotopes of Fe, Cr, Ni, Zn, Os, Rub, and Pt, obtained by electrolysis with special attention to preparation of very thin foils (on the order of microns) with minimum loss of material. The method consists essentially of depositing the isotopically enriched metal on a thin copper substrate (10 -- 100 μ thick) which was subsequently dissolved (with the exception of zinc, where the foil was

Card 1/2

L 25442-66

ACC NR: AT6008412

0
prepared on polished aluminum substrate and removed mechanically). The electrolysis was carried out in an electrolyzer made of organic glass. The procedure for each metal is described in detail. Provision was made to regenerate the undeposited material. The targets were used for nuclear-spectroscopy research and proved to be of good quality. The initial batch of isotopic material can be reduced to 100 -- 200 mg if a small number of foils is required (2 -- 3 foils of 20 -- 25 mm diameter). The advantages of this method over the commercial method lie in the fact that the waste is considerably reduced. Orig. art. has: 2 figures and 1 table.
